

Aobo Mac OS X Keylogger Faqs: How to set the Email tab settings?

Here are example settings for the email configuration.

We recommend free Gmail which supports SMTP, use it just as smtp server to send the logs.

Register one here: <http://gmail.com>

For Gmail:

>>>> send to = your email address.

>>>> smtp server = smtp.gmail.com

>>>> user name = your gmail email address

>>>> your gmail password

>>>> port 587 (If you are using aobo keylogger v3.1 or older, you may use port 465 here)

>>>> USE SSL = yes

For hotmail:

>>>> send to = your email address.

>>>> smtp server = smtp.live.com

>>>> user name = your hotmail email address

>>>> your password

>>>> port 587

>>>> USE SSL = yes

For Aol mail:

>>>> send to = your email address.

>>>> smtp server = smtp.aol.com

>>>> user name = your aol email address

>>>> your password

>>>> port 587

>>>> USE SSL = yes

For Yahoo Email

>>>> send to = your email address.

>>>> smtp server = smtp.mail.yahoo.com

>>>> user name = Your Yahoo email address (for example, "test@yahoo.com")

>>>> your yahoo password

>>>> port 587

>>>> USE SSL = no

For Mail.com mail:

>>>> send to = your email address.

>>>> smtp server = smtp.mail.com

>>>> user name = your mail.com email address

>>>> your password

>>>> port 587

>>>> USE SSL = no

If you have your own domain email such as "xxx@yourdomain.com", here is example setting for you:

>>>> send to = your email address. Eg: xxx@yourdomain.com

>>>> smtp server = mail.yourdomain.com or something else you set up

Aobo Mac OS X Keylogger Faqs: How to set the Email tab settings?

>>>> user name = your email address Eg: xxx@yourdomain.com
>>>> your password
>>>> port 25
>>>> USE SSL = no

Configure the email according to the above examples and send a test email to make sure it works.

If email doesn't work for you, you may try to use FTP to receive logs: [Use FTP Space to store the Logs](#)
